

TwinFit

AI Virtual Try-On & Size Intelligence for Indian Fashion

India's Fit Problem, Solved · One line of code for any retailer

Every third order comes back

25–35%

return rate in Indian
fashion e-commerce

\$21.6B

market size, growing
at 24% CAGR

#1

reason for returns:
wrong size & fit

Shoppers can't tell if an M at Zara equals an M at Myntra — and they can't see the garment on their own body. **Every return costs the retailer shipping, repackaging, and often the customer.**

TwinFit: three answers in one widget

1

Size Intelligence

Brand-calibrated charts (H&M, Zara, Myntra). Confidence %, fit notes tuned for ethnic wear, and a return-risk flag.

2

AI Garment Analysis

A vision LLM reads the product image: category, sleeve, fit, fabric, color. Zero catalog work for the retailer.

3

Virtual Try-On

IDM-VTON diffusion model renders the shopper wearing the exact garment — same face, same pose, their body.

Shopper flow: measurements → size card → auto-analyzed garment → photo → try-on image. Under two minutes.

The retailer does this — and nothing else

```
<script src="https://twinfitt.app/widget.js" data-brand="myntra" defer></script>  

```

Try It On button appears

The widget injects it under every tagged product image automatically.

TwinFit opens in a modal

Garment pre-loaded, brand pre-set, analysis already running in the background.

Result inside their page

Shopper never leaves the store. Retailer keeps the conversion.

Demonstrated live on a demo retailer storefront in our video.

Built on AMD, engineered to never break

ENGINE CASCADE — every try-on walks this ladder:

1 IDM-VTON @ AMD GPU (ROCm)

Deployed & demonstrated during this hackathon

2 IDM-VTON @ hosted GPU

Managed inference fallback

3 FLUX Kontext @ Fireworks

Last-resort generative fallback

AMD in this project

- IDM-VTON running on AMD GPU via ROCm — PyTorch runs the CUDA codebase unmodified
- Full MI300X deployment kit shipped in repo (scripts + notebook)
- Gemma 3 vLLM/ROCm serving script included

Stack: FastAPI · Next.js · IDM-VTON (SDXL) · Fireworks AI vision · Gradio · Docker

The hackathon's shared GPU pool stress-tested our failover in production conditions — shoppers would never have seen a broken screen.

A wedge into a \$21.6B market

NOW

Working product

End-to-end demo: widget, size engine, garment AI, try-on. AMD deployment code shipped.

STAGE 1

Shopify App (60 days)

Theme extension = zero-code install. One listing reaches every clothing store on Shopify. Billing API = revenue from day one.

STAGE 2

D2C & marketplace API

Myntra Rising Stars sellers, AJIO, white-label API for large D2C brands.

STAGE 3

Fit-data flywheel

Every try-on and avoided return trains India-specific size models — the data moat.

Pricing: SaaS subscription + per-try-on fee. A 20% return reduction pays for TwinFit many times over.

TwinFit

Built solo in 72 hours: working product, B2B embed, four-engine AI architecture, AMD deployment demonstrated on real silicon.

India's fit problem, solved — one script tag at a time.
